11. EXCEPTIONS

Ex. No. : 11.1 **Date:**

Register No.: 230701362 **Name:THARUNRAJ I**

Write a Python program that asks the user for their age and prints a message based on the age. Ensure that the program handles cases where the input is not a valid integer.

Input Format: A single line input representing the user's age.

Output Format: Print a message based on the age or an error if the input is invalid.

For example:

Input	Result
twenty	Error: Please enter a valid age.
25	You are 25 years old.
-1	Error: Please enter a valid age.

CODE:

```
try:
    n=int(input())
    assert n>=0
    print("You are %d years old."%(n))
except:
    print("Error: Please enter a valid age.")
```

Ex. No. : 11.2 **Date:**

Register No.: 230701362 **Name:THARUNRAJ I**

Problem Description:

Write a Python program that asks the user for their age and prints a message based on the age. Ensure that the program handles cases where the input is not a valid integer.

Input Format:

A single line input representing the user's age.

Output Format:

Print a message based on the age or an error if the input is invalid.

For example:

Input	Result
25	You are 25 years old.
rec	Error: Please enter a valid age.
-5	Error: Please enter a valid age.

CODE:

```
try:
    n=int(input())
    if(n>0):
        print("You are %d years old."%(n))
    if(n<=0):
```

```
        print("Error: Please enter a valid age.")
except:
    print("Error: Please enter a valid age.")
```

Ex. No. : 11.3 **Date:**

Register No.: 230701362 **Name:THARUNRAJ I**

Problem Description:

Write a Python script that asks the user to enter a number within a specified range (e.g., 1 to 100). Handle exceptions for invalid inputs and out-of-range numbers.

Input Format:

User inputs a number.

Output Format:

Confirm the input or print an error message if it's invalid or out of range.

For example:

Input	Result
1	Valid input.
101	Error: Number out of allowed range
rec	Error: invalid literal for int()

CODE:

```
try:
    n=int(input())
    assert n>0 and n<101
except ValueError:
    print("Error: invalid literal for int()")
```

```
except:
    print("Error: Number out of allowed range")
else:
    print("Valid input.")
```

Ex. No. : 11.4 **Date:**

Register No.: 230701362 **Name:THARUNRAJ I**

Problem Description:

Develop a Python program that safely calculates the square root of a number provided by the user. Handle exceptions for negative inputs and non-numeric inputs.

Input Format:

User inputs a number.

Output Format:

Print the square root of the number or an error message if an exception occurs.

For example:

Input	Result
16	The square root of 16.0 is 4.00
-4	Error: Cannot calculate the square root of a negative number.
rec	Error: could not convert string to float

CODE:

```
import math

def sqrt(a):

    if(a>-1):

        print("The square root of",a,'is',"%0.2f"%math.sqrt(a),sep=' ')

try:

    a=float(input())
```

```
    sqrt(a)
except ValueError:
    print("Error: could not convert string to float")
else:
    if(a<0):
        print("Error: Cannot calculate the square root of a negative
number. ")
```

Ex. No. : 11.5 **Date:**

Register No.: 230701362 **Name:THARUNRAJ I**

Develop a Python program that safely performs division between two numbers provided by the user. Handle exceptions like division by zero and non-numeric inputs.

Input Format: Two lines of input, each containing a number.

Output Format: Print the result of the division or an error message if an exception occurs.

For example:

Input	Result
10 2	5.0
10 0	Error: Cannot divide or modulo by zero.
ten 5	Error: Non-numeric input provided.

CODE:

```
try:
    n=float(input())
    d=int(input())
    print(n/d)
except ZeroDivisionError:
```

```
    print("Error: Cannot divide or modulo by zero.")
except ValueError:
    print("Error: Non-numeric input provided.")
```
